

THERMiVa®

ThermiVa the latest state of the art, low risk solution for women whose lives are interrupted by incontinence and leakage, vaginal dryness, and/or vaginal laxity. With ThermiVa, women have an option that is safe, simple and generally pain free option for female rejuvenation that until recently could only be accomplished with surgery.

How does ThermiVa work?

ThermiVa works by using radio-frequency heat that is delivered into the vagina, as well as applied to the vulva using thin, s-shaped probe. The gentle application of heat stimulates collagen production, resulting in the strengthening and tightening the vaginal tissues while also increasing flexibility and lubrication.

Getting Started

Step 1:

Schedule your consultation.

Step 2:

Schedule your treatments. The procedure is made up of three thirty minute procedures (allow one hour total for each appointment).

Step 3:

Go on with your day!

Patients must have or provide the results of a normal pap test dated within the last three years and cannot be pregnant in order to undergo the procedure.
